

Custom Laminating

Custom lamination is the process of Thermopatch laminating your material with a heat-seal adhesive and then either die cutting it into patches or slitting it into mending rolls for you.

In order for us to laminate a new material, we will require a sample of the material approximately 1 square yard in size for testing to see which adhesive gives the best adhesion, once this is established we can then quote a price based on the amount of yards that is sent to us.

Our standard custom lamination minimum is 10 linear yards, however, we can quote yardage smaller than this.

For a list of standard materials we stock, please visit the mending page to see our mending chart.

If your custom patch needs are small, visit the Thermoply page to make your own patches with your material at your facility.
